## 1. GENERAL BACKGROUND INFORMATION

### ACRONYMS AND ABBREVIATIONS USED IN THIS BULLETIN

ACTS	- Automated Computer Time Service		
BIPM	- Bureau International des Poids et Mesures		
CS	- Cesium Standard		
GPS	- Global Positioning System		
IERS	- International Earth Rotation Service		
LORAN	- Long Range Navigation		
MC	- Master Clock		
MJD	- Modified Julian Date		
NVLAP	- National Voluntary Laboratory Accreditation Program		
NIST	- National Institute of Standards and Technology		
NOAA	- National Oceanic and Atmospheric Administration	ns	- nanosecond
SI	- International System of Units	μs	- microsecond
TA	- Atomic Time	ms	- millisecond
TAI	- International Atomic Time	s	- second
USNO	- United States Naval Observatory	min	- minute
UTC	- Coordinated Universal Time		

## 2. TIME SCALE INFORMATION

The values listed below are based on data from the IERS, the USNO, and NIST. The UTC(USNO,MC) - UTC(NIST) values are averaged measurements from all available common-view GPS satellites (see bibliography on page 5). **UTC - UTC(NIST) data are on page 3.**

0000 HOURS COORDINATED UNIVERSAL TIME			
JUL 2006	MJD	UT1-UTC(NIST) (±5 ms)	UTC(USNO,MC) - UTC(NIST) (±20 ns)
6	53922	190 ms	8 ns
13	53929	188 ms	7 ns
20	53939	183 ms	3 ns
27	53943	182 ms	3 ns

NOTE: No leap second will be added at the end of December 2006.

The master clock pulses used by the WWV, WWVH, and WWVB time-code transmissions are referenced to the UTC(NIST) time scale. Occasionally, 1 s is added to the UTC time scale. This second is called a leap second. Its purpose is to keep the UTC time scale within ±0.9 s of the UT1 astronomical time scale, which changes slightly due to variations in the Earth's rotation.

Positive leap seconds, beginning at 23 h 59 min 60 s UTC and ending at 0 h 0 min 0 s UTC, were inserted in the UTC timescale on 30 June 1972, 1981-1983, 1985, 1992, 1993, 1994, and 1997, and on 31 December 1972-1979, 1987, 1989, 1990, 1995, 1998 and 2005.

The use of leap seconds ensures that UT1 - UTC will always be held within ±0.9 s. The current value of UT1 - UTC is called the DUT1 correction. DUT1 corrections are broadcast by WWV, WWVH, WWVB, and ACTS and are printed below. These corrections may be added to received UTC time signals in order to obtain UT1.

DUT1 = UT1 - UTC =	-0.4 s beginning 0000 UTC 03 April 2003
	-0.5 s beginning 0000 UTC 29 April 2004
	-0.6 s beginning 0000 UTC 17 March 2005
	+0.3 s beginning 0000 UTC 01 January 2006
	+0.2 s beginning 0000 UTC 27 April 2006

The difference between UTC(NIST) and UTC has been within  $\pm 100$  ns since July 6, 1994. The table below shows values of UTC - UTC(NIST) as supplied by the BIPM in their Circular T publication for the most recent 310 day period in which data are available. Data are given at 10 day intervals. Five day interval data are available in Circular T.

0000 Hours Coordinated Universal Time

DATE	MJD	UTC-UTC(NIST) ns
Jun. 23, 2006	53909	8.5
Jun. 13, 2006	53899	6.9
Jun. 03, 2006	53889	7.1
May 24, 2006	53879	6.6
May 14, 2005	53869	6.2
May 04, 2006	53859	7.0
Apr. 24, 2006	53849	6.2
Apr. 14, 2006	53839	6.0
Apr. 04, 2006	53829	6.2
Mar. 25, 2006	53819	5.7
Mar. 15, 2006	53809	3.8
Mar. 05, 2006	53799	3.2
Feb. 23, 2006	53789	2.5
Feb. 13, 2006	53779	1.3
Feb. 03, 2006	53769	2.0
Jan. 24, 2006	53759	2.0
Jan. 14, 2006	53749	4.1
Jan. 04, 2006	53739	4.1
Dec. 25, 2005	53729	3.7
Dec. 15, 2005	53719	2.6

Nov. 05, 2005	53679	-7.2
Oct. 26, 2005	53669	-9.7
Oct. 16, 2005	53659	-11.5
Oct. 06, 2005	53649	-12.2
Sep. 26, 2005	53639	-12.7
Sep. 16, 2005	53629	-12.6
Sep. 06, 2005	53619	-11.8

### 3. PHASE DEVIATIONS FOR WWVB AND LORAN-C

WWVB - The values shown for WWVB are the time differences between the time markers of the UTC(NIST) time scale and the first positive-going zero voltage crossover measured at the transmitting antenna. The uncertainty of the individual measurements is  $\pm 0.5 \mu\text{s}$ . The values listed are for 1300 UTC.

LORAN-C - The values shown for Loran-C represent the daily accumulated phase shift. The phase shift is measured by comparing the output of a Loran receiver to the UTC(NIST) time scale for a period of 24 h. If data were not recorded on a particular day, the symbol (-) is printed. The stations monitored are Baudette, Minnesota (8970) and Boise City, Oklahoma (9610). The monitoring is done from the NIST laboratories in Boulder, Colorado.

**Note: The values shown for Loran-C are in nanoseconds.**

DATE	MJD	UTC(NIST)-WWVB (60 kHz)	UTC(NIST) - LORAN PHASE (ns)	
		ANTENNA PHASE ( $\mu\text{s}$ )	LORAN-C (BAUDETTE) (8970)	LORAN-C (BOISE CITY) (9610)
07/01/06	53917	5.65	-14	-3
07/02/06	53918	5.65	-161	+2
07/03/06	53919	5.65	-8	-0

#### 4. BROADCAST OUTAGES OVER FIVE MINUTES AND WWVB PHASE PERTURBATIONS

OUTAGES OF 5 MINUTES OR MORE						PHASE PERTURBATIONS 2 ms			
Station	JUL 2006	MJD	Began UTC	Ended UTC	Freq.	JUL 2006	MJD	Began UTC	End UTC
WWVB					60 kHz				
WWV									
WWVH									

#### 5. NOTES ON NIST TIME SCALES AND PRIMARY STANDARDS

Primary frequency standards developed and operated by NIST are used to provide accuracy (rate) input to the BIPM. NIST-F1, a cold-atom cesium fountain frequency standard, has served as the U.S. primary time and frequency standard since 1999. The uncertainty of NIST-F1 is currently about 5 parts in  $10^{16}$ .

The AT1 scale is run in real-time by use of data from an ensemble of cesium standards and hydrogen masers. It is a free-running scale whose frequency is maintained as nearly constant as possible by choosing the optimum weight for each clock that contributes to the computation.

UTC(NIST) is generated as an offset from our real-time scale AT1. It is steered in frequency towards UTC by use of data published by the BIPM in its Circular T. Changes in the steering frequency will be made, if necessary, at 0000 UTC on the first day of the month, and occasionally at mid-month. A change in frequency is limited to no more than  $\pm 2$  ns/day. The frequency of UTC(NIST) is kept as stable as possible at other times.

UTC is generated at the BIPM using a post-processed time-scale algorithm and is not available in real-time. The parameters that we use to generate UTC(NIST) in real-time are therefore based on an extrapolation of UTC from the most recent available data.

Table 7.1 lists parameters that are used to define UTC(NIST) with respect to our real-time scale AT1. To find the value of UTC(NIST) - AT1 at any time T (expressed as a Modified Julian Day, including a fraction if needed), the appropriate equation to use is the one for which the desired T is greater than or equal to the entry in the  $T_0$  column and less than the entry in the last column. The values of  $x_s$ , x, and y for that month are then used in the equation below to find the desired value. The parameters x and y represent the offset in time and in frequency, respectively, between UTC(NIST) and AT1; the parameter  $x_s$  is the number of leap seconds applied to both UTC(NIST) and UTC as specified by the IERS. Leap seconds are not applied to AT1.

Table 7.1 $UTC(NIST) - AT1 = x_s + x + y*(T - T_0)$					
Month	$x_s$ (s)	x (ns)	y (ns/d)	$T_0$ (MJD)	Valid until 0000 on: (MJD)
